

PUBLIC NOTIFICATION
REPORTING VIOLATION OF THE
MAXIMUM RESIDUAL DISINFECTANT LEVEL

The De Soto Public Water Supply is required by state and federal regulations to submit a monthly report summarizing the disinfectant levels found in the drinking water.

This monthly summary is required to be submitted to the Iowa Department of Natural Resources to report whether or not the Maximum Residual Disinfectant Level of 4.0 mg/L of total chlorine is the drinking water was exceeded during the previous 12 months. Chlorine is beneficial at low levels to control microbes, such as Coliform bacteria, but may have adverse health risks at high levels.

The De Soto Public Water Supply regrets its failure to report the Maximum Disinfectant Level in June 2018 and will work to make sure that the required information is submitted in the future.

Customers with questions or concerns about the Maximum Residual Disinfectant Levels, or any other water problem, should contact:

Dan Van Langen
Public Works Director
City of De Soto
phone # (515) 208-0066.

This public notification is in direct connection with the previous Water Monitoring Violation Public Notice that was posted in July. At this time there is nothing that needs done by our water customers and **it is important to note that the De Soto Public Water Supply is safe for consumption and has not been compromised.**
